[Antenna Sickness 2017](#)

Journalist Amy Worthington: "The modulated, information-carrying radio waves inherent in wireless technologies emit a variety of hideously repetitious rhythmic pulses. When you listen to wireless microwave radiation, you hear an unnerving cacophony of grinding tones, octaves, pitches and rhythms, all playing across the land with the intensity of a pneumatic drill. The Wireless Revolution has unleashed a nationwide 'symphony' of ultra-high frequencies, blazing from millions of antennas in the keys of heart disease, diabetes, brain dysfunction and cancer. Wireless 'music' is a REQUIEM FOR THE MASSES."

Want to Survive the Wireless Age? Listen to the Music!

Here is a major paradox of our times. An entrance door of this large commercial building boasts a healthy environment thanks to a ban on smoking. But wireless IT signal generators irradiate this entire structure, both inside and out, with high-frequency microwave pollution documented in medical literature to: **disable the human immune system, create abnormal electrical activity in the brain, cause severe oxidative stress in tissues, agglutinate (clump) red blood cells, promote abnormal blood sugar, propel a percentage of people into abnormal heart activity, damage the DNA, induce tumors or lymphoma and ramp up the growth fraction of existing malignancies.**

The Acoustimeter shown above reveals that the industrial grade microwave radiation delivered to office workers in this building changes power density continuously, pulsing erratically back and forth between .07 to 1 volt per meter² in a violent, staccato rhythm mixed with the sound of a buzz saw. People need their jobs, so they meekly endure this radiation assault. Likely no one has told them that a secure, unhackable fiber optic IT system provides the best of communications and security, while keeping buildings safe for human health. The chronically irradiated workers in this building, like millions of others, are human flies in a sticky web known as the Microwave Age.

Today's wireless pollution is ubiquitous and universal in a way that tobacco smoke and asbestos have never been. The wireless radiation industry inundates the human environment with torrents of wave carcinogen because the masses are completely oblivious to this pollution.

If people can't touch, see, smell, taste or hear it, they don't "get it."

Should humans walk unknowingly into a uranium mine or set up a picnic on radioactive mine tailings, they would not suspect mortal danger. To understand the peril, they would need a nuclear Geiger counter to **make audible** the counts per minute of cancer-causing radioactive isotopes decaying in the near environment. Counts per minute enumerate the intensity of nuclear radiation, a confirmed carcinogen.

Likewise, the non-ionizing RF/microwave radiation now blasting from millions of Wi-antennas nationwide is **detectable only with reliable measuring equipment**. The human auditory system is not designed to hear millions or billions of hertz. Concerned people absolutely need a detection device which can alert them to the presence of this pernicious hazard. Everyone should HEAR the shrieking, grinding, clicking, buzzing and whining of the RF/microwave frequencies now permeating the outdoor environment and contaminating the interior of most buildings and vehicles. Once people actually hear the voltage pollution of wireless technologies, **their eyes (not to mention their blood-brain barrier) are widely opened**.

There are numerous RF/microwave metering devices available to consumers. The researchers who maintain this website highly recommend the **Acoustimeter Model AM-10, seen above and below**. The Acoustimeter was designed in Europe by technicians who have gained experience from years of practical RF and microwave measurements. It is a sturdy broadband instrument which accurately measures the totality of the Wi-radiation in the electromagnetic range of 200 million hertz (MHz) to 8 billion hertz (GHz). This is the range of frequencies deployed by most modern Wi-communication systems encountered in the everyday environment. If you hear high-frequency noise on the Acoustimeter, you know that you are in Cancer Country.

The Acoustimeter **instantly reveals how much voltage per meter** is flowing through a human body caught in a Wi-environment. The voltage measurement is important because cancer experts with the International Agency for Research on Cancer confirm that this Wi-voltage is a Group 2B carcinogen which couples with human flesh **"resulting in induced electric and magnetic fields and associated currents inside tissues."** There is no provably safe dose of RF/microwave voltage, just as there is no provably safe dose of any other environmental carcinogen.

Seen above is a smart phone on standby. Whenever this phone is turned on, it excretes microwave signals perpetually. When this photo was taken, **the Wi-Fi function was not on, nor was the phone making a call**. It was continually searching for connection. To do this, it generated a microwave power density vacillating between 4.5 to 6 volts per meter. The energy loudly activated the Acoustimeter, as seen by the flashing lights. This voltage power density is hundreds of times higher than RF/microwave power levels documented to cause dangerous bio-effects in both humans and animals. The latest science confirms that mobile phone radiation at these levels is irrevocably linked to the two most widely recognized pathologies of high-tech: **cancer of the brain and cancer of the breast**. Using the Acoustimeter for visual and audio confirmation, we now understand why mobile phones on stand-by, carried in trouser pockets, are heavily documented to **decimate sperm**. We understand why these phones tucked into bras can eventually generate breast tumors.

Some smart phone and Wi-tablet instruction manuals warn users to keep wireless devices at least an inch away from the body. But the Acoustimeter picks up voltage from the above smart phone twenty feet away. Incidentally, since all mobile phones are tracking devices, hackers and government agencies can also "hear" the "noise" from devices remotely, which allows snoopers to gather immense quantities of personal data through numerous pathways. The Acoustimeter demonstrates how Wi-addicts invade the space of others with far-reaching pollution emanating from their personal Wi-devices, from their radiation-riddled properties and from their hotspot vehicles. Make a Wi-addict listen to "the music" on an Acoustimeter, and he will **beg you to turn it off!** For such delicate ears, the audio signals can be muted. More preferable is **the muting of this carcinogen** with the flick of an off button or the removal of a battery, because the human DNA can "hear" these signals while the ear cannot.

The Acoustimeter enables people to see how invisible wave teratogen (causes birth defects and neurological impairments) flows as electromagnetic currents through America's ovaries, testes, ova, sperm and fetuses. Take a measurement directly on the skin of an infant lying next to a wireless baby monitor. Get a reading next to the solar plexus of a kid playing for hours with a wireless game console. Now we begin to understand why so many of America's young are energetically weak, immune deficient, struggling with learning disabilities and afflicted with chronic health disorders.

The Acoustimeter is lightweight and easy to carry and use. Powered by two AA batteries, it can "play" **simultaneously** numerous types of signals overlaying our Wi-environment. This helps us to determine, with a small amount of practice, which types of signal generators are being heard: smart phone, cell tower, Wi-Fi, DECT phone, etc.

RF/Microwave power density readings are shown on the Acoustimeter with two series of graduated LED lights. The set of lights facing left shows voltage, the lights facing right show microwattage, another important measurement used by the Federal Communications Commission (FCC) for exposure and emissions guidelines. The LEDs update rapidly, demonstrating how wireless radiation continually changes power density. The LCD display at the top of the instrument also offers high accuracy with a lower update speed, allowing time to study the average of the readings.

The Acoustimeter is especially valuable while driving. You don't need to read the digital screen. Just LISTEN. The screaming cell tower radiation you hear raging through the inside of your car is the same high-frequency energy renown for obliterating human double helix DNA into molecular splinters called micronuclei. Micronuclei damage is the forerunner of human cancers.

Here is Information Gleaned from the Acoustimeter:

◆ **Cell tower and rooftop communications antennas emit a high-pitched scream similar to a fire siren.** This antenna pollution is, figuratively speaking, the "brass section" of our national wireless symphony. If you like the sound of fingernails scratching along a blackboard, you will LOVE the cell tower scream. Intermingled with "the scream" is often heard clicking, whistling and/or grinding tone gyrations involving the lower frequency data signals superimposed onto the microwave carrier signals. The sinister cell tower howl can be heard at either high or low power density almost everywhere across our nation these days.

◆ **Wi-Fi signals are propagated in many sound-flavors, but most systems emit a pulsing, grinding or crackling sound similar to the relentless static of a buzz saw.** The Wi-Fi beacon signal, always on, emits a woodpecker cadence which suggests a sort of "percussion section" of the national wireless symphony. Both indoors and out, Wi-Fi systems literally saturate the environment with the repulsive buzzing of gigahertz radiation. There is virtually no end to the number of items which consumers can now buy and use to generate these toxic signals. Wi-Fi pollution, generally propagated for hundreds of feet, is completely unregulated. Anyone can use it to attack, sicken or even slowly terminate his neighbors.

◆ **Personal wireless devices and building security systems emit their own unique energetic hisses, whistles and static clicks.** DECT phone bases and baby monitors emit a perpetual static roar. There is hissing and crackling from transceiving laptops, cell phones, tablets and other wireless gizmos as they propagate vociferous wave carcinogen. When you listen to the energy raging from phones, tablets, routers, Wi-Fi boosters, play stations, security systems, Bluetooth headsets, household "hubs," vehicle infotainment systems and the cool "smart" meter mounted outside on the wall behind your bed, you begin to understand what it is that jackhammers the DNA and creates momentum for diabetes, dementia and cancer.

**The herd USA obviously believes
that Wi-technologies comes first, human life last.**

**However, those who dare to differ with this "group-think"
and those who wish to preserve and protect:**

**eyesight
hearing
brain function
and
genetic integrity**

-- can use the Acoustimeter for many health-saving functions.

- ◆ **Quickly confirm that RF/microwave radiation is polluting the general environment and become empowered to identify the location and sources of this pollution.**
- ◆ **Determine the levels of Wi-pollution emanating from all personal mobile devices, whether in stand-by or in transceiving mode. Listen to the raging inferno of a cordless phone base and monitor the effluent pouring from a cordless handset when in use.**
- ◆ **Discover that even when you TURN OFF the Wi-Fi and Bluetooth on your personal HARDWIRED computer, you still get microwave noise. Then confirm that the noise is gone after a technician removes all wireless chips from the board inside the computer.**
- ◆ **Demonstrate to others that wireless energy exists as a relentless driving force capable of loudly activating a meter, just as it affects every form and function of the human body.**
- ◆ **Protect the unborn and the newly born from the neurological and developmental damage of microwaves. Place the Acoustimeter on the pregnant belly of a mother broiling in Wi-Fi so that she can hear the genetically-damaging, heart-disrupting Wi-voltage flowing through the amniotic fluid where the baby is trying to develop.**
- ◆ **Compare Wi-radiation fields with clusters of sickness and disability in highly-irradiated buildings and neighborhoods. (A group of people can chip in on a good meter for community monitoring projects.)**
- ◆ **Listen to the astonishing power density of the radiation leaking from your microwave oven while it is in operation. (You'll want to leave the kitchen for sure.)**
- ◆ **Ensure that all your personal living and working spaces are free from Wi-radiation and that they remain that way. Choosing to protect yourself against this carcinogen will take you to the brave new world of radiation mitigation. Use the Acoustimeter to confirm the success of your mitigation efforts.**

Order your Acoustimeter at the above link or at Amazon.com.

Note: In the Wireless Age, whatever we do, wherever we go, whenever we buy, **someone** has devised a way to deliver **bio-active Wi-carcinogen** to our bodies without disclosure of the health risks. It gets **VERY PERSONAL** when RF/microwave delivery systems -- including covert information-gathering devices -- end up in the home. **The only solution is: INFORMATION, DETECTION, DEACTIVATION.** Click below to see how the **ZIGBEE RADIO TRANSMITTER** in a "smart" refrigerator can "cook" the house with microwave signals capable of Internet connectivity. As you listen to the pulsing of the know-it-all fridge in this video, recall that the Wi-industry is working feverishly to usher in the **INTERNET OF THINGS (IoT)**. These fanatics won't rest until multi-billions of radiation-spewing consumer products of every description (even rectal thermometers?) are enjoined to "Rock 'N Roll" with the IoT.
